D1X Series Draper Header for Self-Propelled Windrowers Quick Card - MD #214045 Revision A
Supplement to D1X Series Draper Header for Self-Propelled Windrowers Operator's Manual

MacDon
The harvesting specialists worldwide.

Notes for using the Recommended Settings Chart

Header Angle

Header angle is the angle between the drapers and the ground and is adjustable to accommodate crop conditions and/or soil types.

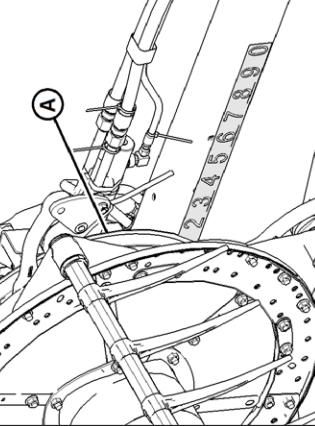

The angle is displayed as a value from 0 (shallow) to 10 (steep) on the windrower Harvest Performance Tracker (HPT).

Knife Speed

Knife speed is displayed on the windrower Harvest Performance Tracker (HPT) in strokes per minute (spm), and is adjustable with the controls in the windrower cab.

Reel Speed

Operate the reel at suggested percentage above ground speed.

Reel Fore-Aft

Use back edge of reel cam disc (A) and decal on reel support arm as a gauge.

Adjust fore-aft position with fore-aft controls in windrower cab.

Reel Tine Pitch

Turn cam latch pin (A) to unlock

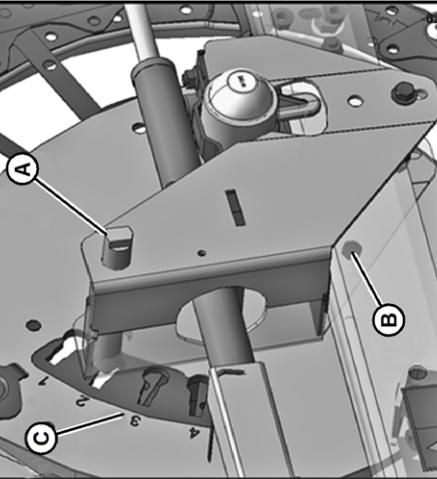

cam disc.

Use wrench on bolt (B) until latch pin lines up with appropriate cam setting (C) between 1 and 4.

Increasing the cam setting increases the aggressiveness of the reel for picking up downed crop.

Skid Shoes

Remove lynch pin (A), disengage pin (B) from the frame, and move skid shoe (C) to desired position. There are three hole positions: top, middle, and bottom.

For a lower cutting level, raise the skid shoe by installing pin (B) in the bottom hole.

Float

The recommended float setting is 334–378 N (75–85 lb). Rocky conditions or cutting at faster ground speeds may require that float be set heavier to prevent excessive header movement. Refer to windrower operator's manual for procedures.

Draper Speed

Draper speed is set based on ground speed, crop mass, volume, and windrow formation. Faster ground speed or heavier crop requires increased draper speed to convey material. Slower ground speed or lighter crop requires slower draper speed to ensure even crop flow. Refer to windrower operator's manual.
