

Gently Well-Formed Windrows & Excellent Seed Retention

Two pairs of rotating drums replace the traditional conditioner. These drums are adjusted hydraulically in-cab and are designed to gently form the edges of the windrow. Those rollers get paired with a single stream configuration that guides the crop to the center of the header, working together to minimize seed loss.

The Anti-Shatter Shield prevents the crop from hitting the top of the header, reducing seed loss. In addition, with the touch of a button, the shield folds down for short crops to increase visibility. Couple this with a single stream configuration to further minimize seed loss risk.

Important to know:

- Compatible with the M1240
- Cannot be used with the DWA (Double Windrow Attachment)
- Cannot be used with Remote Baffle Control
